人工智能实践: Tensorflow笔记

曹健

北京大学

软件与微电子学院

本讲目标:用RNN实现连续数据的预测(以股票预测为例)

回顾卷积神经网络

循环神经网络

循环核

循环核时间步展开

循环计算层

TF描述循环计算层

循环计算过程

实践: ABCDE字母预测

One-hot

Embedding

实践: 股票预测

RNN

LSTM

GRU

✓ 卷积核:参数空间共享,卷积层提取空间信息。

卷积神经网络网络的主要模块

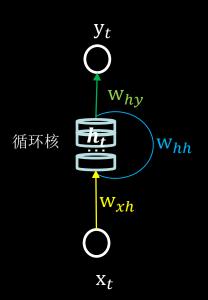

卷积是什么? 卷积就是特征提取器,就是CBAPD

卷积神经网络:借助卷积核提取空间特征后,送入全连接网络。

鱼离不开 水

✓ 循环核:参数时间共享,循环层提取时间信息。

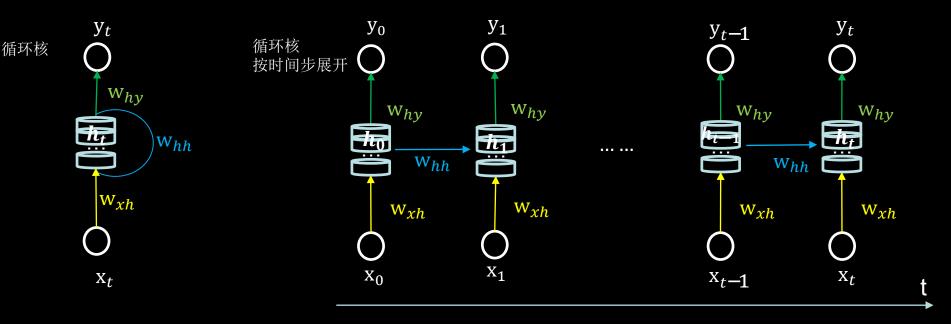

前向传播时:记忆体内存储的状态信息ht,在每个时刻都被刷新,三个参数矩阵wxh whh why自始至终都是固定不变的。

反向传播时:三个参数矩阵wxh whh why被梯度下降法更新。

$$y_t = softmax(h_t w_{hy} + by)$$

$$\mathbf{h}_t = \tanh(x_t \mathbf{w}_{xh} + h_{t-1} \mathbf{w}_{hh} + \mathbf{bh})$$

✓ 循环核按时间步展开。

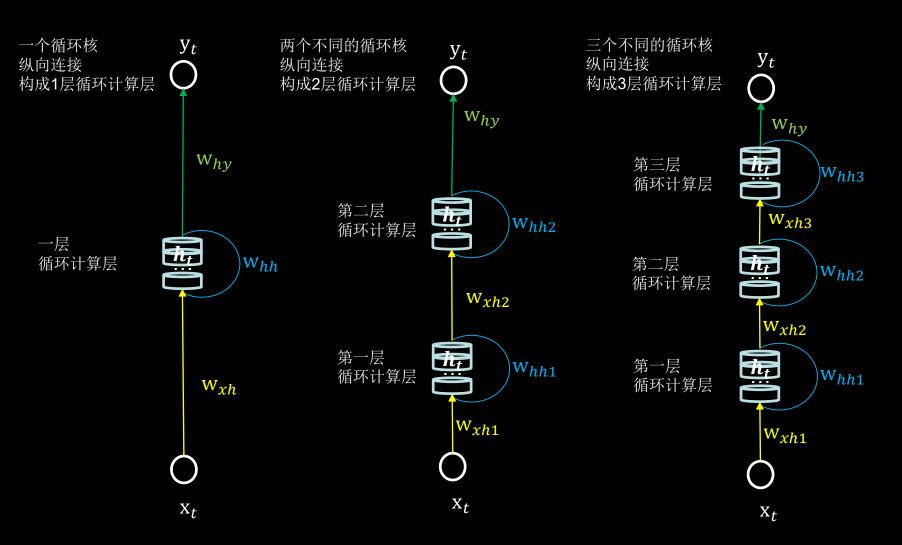

$$y_t = softmax(h_t w_{hy} + by)$$

$$\mathbf{h}_t = \tanh(x_t \mathbf{w}_{xh} + h_{t-1} \mathbf{w}_{hh} + \mathbf{bh})$$

循环神经网络:借助循环核提取时间特征后,送入全连接网络。

✓ 循环计算层: 向输出方向生长。

✓ TF描述循环计算层

tf.keras.layers.SimpleRNN(记忆体个数, activation='激活函数',

return_sequences=是否每个时刻输出ht到下一层)

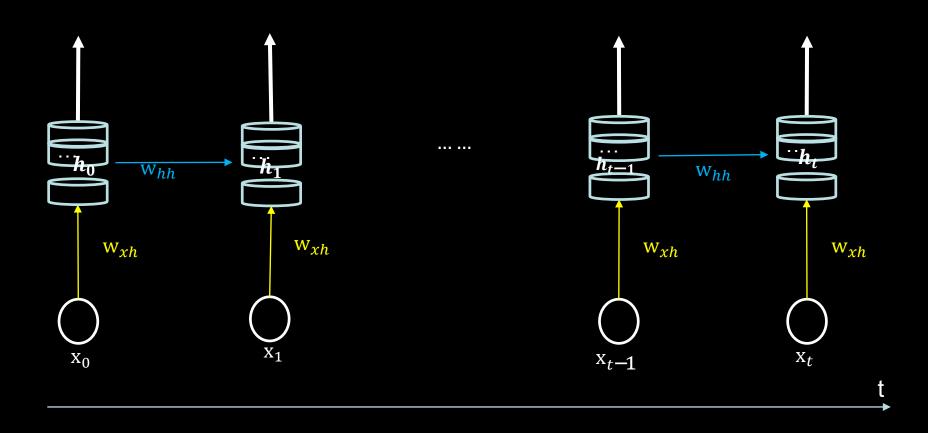

activation='激活函数'(不写,默认使用tanh)

return_sequences=True 各时间步输出ht

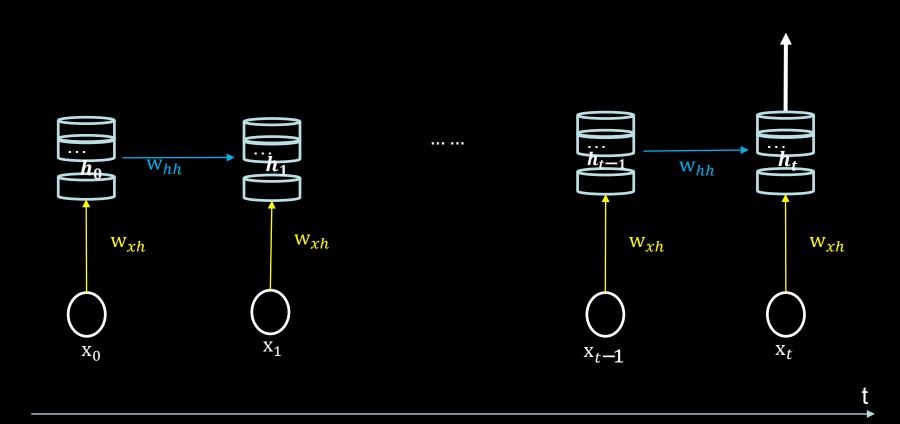

return_sequences=False 仅最后时间步输出ht(默认)

例: SimpleRNN(3, return_sequences=True)

return_sequences = True 循环核各时刻会把ht推送到到下一层

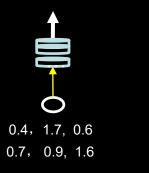

return_sequences= False 循环核仅在最后一个时刻把ht推送到到下一层

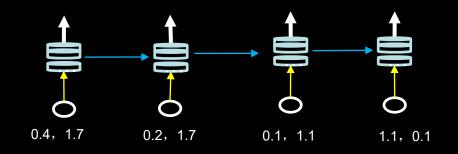

✓ TF描述循环计算层

入RNN时, x_train维度:

[送入样本数, 循环核时间展开步数, 每个时间步输入特征个数]

RNN层期待维度: [2, 1, 3]

RNN层期待维度: [1, 4, 2]

✓ 循环计算过程

b

输入字母

词向量空间:

10000

а

		字母预测:输入a预测出b,输入b预测出c,	01000	b
输出 预测	С		00100	С
		₁ 输入c预测出d,输入d预测出e,输入e预测出a [00010	d

```

✓ Embedding —— 一种编码方法

独热码:数据量大过于稀疏,映射之间是独立的,没有表现出关联性

Embedding: 是一种单词编码方法,用低维向量实现了编码,

这种编码通过神经网络训练优化,能表达出单词间的相关性。

tf.keras.layers.Embedding(词汇表大小,编码维度)

编码维度就是用几个数字表达一个单词

对1-100进行编码, [4] 编码为 [0.25, 0.1, 0.11]

例: tf.keras.layers.Embedding(100, 3)

入Embedding时, x_train维度:

[送入样本数,循环核时间展开步数]

用RNN实现输入一个字母,预测下一个字母(Embedding 编码)

```
import numpy as np
     import tensorflow as tf
     from tensorflow.keras.layers import Dense, SimpleRNN, Embedding
     import matplotlib.pyplot as plt
     import os
     input word = "abcde"
     w to id = {'a': 0, 'b': 1, 'c': 2, 'd': 3, 'e': 4} # 单词映射到数值id的词典
     x train = [w to id['a'], w to id['b'], w to id['c'], w to id['d'], w to id['e']]
10
     y train = [w to id['b'], w to id['c'], w to id['d'], w to id['e'], w to id['a']]
11
12
13
     np.random.seed(7)
14
     np.random.shuffle(x train)
15
     np.random.seed(7)
     np.random.shuffle(y train)
16
17
     tf.random.set seed(7)
18
19
     # 使x train符合Embedding输入要求: [送入样本数, 循环核时间展开步数],
20
21
     x train = np.reshape(x train, (len(x train), 1))
     y train = np.array(y train)
22
```

```
23
        24
            ⊟model = tf.keras.Sequential([
                Embedding(5, 2),
        25
                SimpleRNN(3),
        26
                Dense(5, activation='softmax')
        27
            1)
        28
            model.compile(optimizer=tf.keras.optimizers.Adam(0.01),
                          loss=tf.keras.losses.SparseCategoricalCrossentropy(from logits=False),
                          metrics=['sparse categorical accuracy'])
        34
             checkpoint save path = "./checkpoint/run embedding 1pre1.ckpt"
        35
            if os.path.exists(checkpoint save path + '.index'):
        36
                print('-----load the model-----')
                model.load weights (checkpoint save path)
            □cp callback = tf.keras.callbacks.ModelCheckpoint(filepath=checkpoint save path,
                                                            save weights only=True,
                                                            save best only=True,
                                                            monitor='loss') # 由于fit没有给出测试集,不计算测试集准确率,根据loss,保存最优模型
        44
             history = model.fit(x train, y train, batch size=32, epochs=100, callbacks=[cp callback])

应用:字母预测

```
73
74
     ############## predict ###########
75
    preNum = int(input("input the number of test alphabet:"))
76

for i in range(preNum):
77
         alphabet1 = input("input test alphabet:")
78
79
         alphabet = [w to id[alphabet1]]
         # 使alphabet符合Embedding输入要求: [送入样本数, 循环核时间展开步数]。
80
         # 此处验证效果送入了1个样本,送入样本数为1;输入1个字母出结果,循环核时间展开步数为1。
81
         alphabet = np.reshape(alphabet, (1, 1))
82
83
         result = model.predict(alphabet)
        pred = tf.argmax(result, axis=1)
84
        pred = int(pred)
85
        tf.print(alphabet1 + '->' + input word[pred])
86
```

用RNN实现输入连续四个字母,预测下一个字母(Embedding 编码)

```
import numpy as np
     import tensorflow as tf

用LSTM实现股票预测

LSTM 由Hochreiter & Schmidhuber 于1997年提出,通过门控单元改善了RNN长期依赖问题。 Sepp Hochreiter,Jurgen Schmidhuber.LONG SHORT-TERM MEMORY.Neural Computation,December 1997.

LSTM计算过程

输入门(门限):
$$i_t = \sigma(W_i.[h_{t-1}, x_t] + b_i)$$

遗忘门(门限):
$$f_t = \sigma(W_f.[h_{t-1},x_t] + b_f)$$

输出门(门限):
$$o_t = \sigma(W_o.[h_{t-1}, x_t] + b_o)$$

细胞态(长期记忆):
$$C_t = f_t * C_{t-1} + i_t * \tilde{C}_t$$

过去 现在

记忆体(短期记忆): $h_t = o_t * tanh(C_t)$

候选态(归纳出的新知识):
$$\widetilde{C}_t = \tanh(W_c.[h_{t-1}, x_t] + b_c)$$

✓ TF描述LSTM层

```
tf.keras.layers.LSTM(记忆体个数,return_sequences=是否返回输出)
return_sequences=True 各时间步输出ht
return_sequences=False 仅最后时间步输出ht(默认)
例:
```

```
model = tf.keras.Sequential([
    LSTM(80, return_sequences=True),
    Dropout(0.2),
    LSTM(100),
    Dropout(0.2),
    Dense(1)
])
```

```
import numpy as np
    import tensorflow as tf
    from tensorflow.keras.layers import Dropout, Dense LSTM
    import matplotlib.pyplot as plt
    import os
    import pandas as pd
    from sklearn.preprocessing import MinMaxScaler
    from sklearn.metrics import mean squared error, mean absolute error
    import math
    maotai = pd.read csv('./SH600519.csv') # 读取股票文件
    training set = maotai.iloc[0:2426 - 300, 2:3].values # 前(2426-300=2126)天的开盘价作为训练集,表格从0开始计数,2:3 是提取[2:3)列,前闭后开,故提取出c列开盘价
13
    test set = maotai.iloc[2426 - 300:, 2:3].values # 后300天的开盘价作为测试集
14
15
16
    sc = MinMaxScaler(feature range=(0, 1)) # 定义归一化: 归一化到(0, 1)之间
17
    training set scaled = sc.fit transform(training set) # 求得训练集的最大值,最小值这些训练集固有的属性,并在训练集上进行归一化
18
    test set = sc.transform(test set) # 利用训练集的属性对测试集进行归一化
20
    x train = []
    y train = []
23
24
    x test = []
   y test = []
25
```

```
26
27
28
29
   for i in range (60, len (training set scaled)):
        x train.append(training set scaled[i - 60:i, 0])
        y_train.append(training set scaled[i, 0])
31
32
     np.random.seed(7)
33
     np.random.shuffle(x train)
34
35
     np.random.seed(7)
36

用GRU实现股票预测

GRU由Cho等人于2014年提出,优化LSTM结构。

Kyunghyun Cho,Bart van Merrienboer,Caglar Gulcehre,Dzmitry Bahdanau,Fethi Bougares,Holger Schwenk,Yoshua Bengio.Learning Phrase Representations using RNN Encoder–Decoder for Statistical Machine Translation.Computer ence, 2014.

GRU计算过程

更新门:
$$z_t = \sigma(W_z.[h_{t-1}, x_t])$$

重置门:
$$r_t = \sigma(W_r.[h_{t-1}, x_t])$$

记忆体:
$$h_t = (1 - z_t) * h_{t-1} + z_t * \tilde{h}_t$$
 过去 现在

候选隐藏层: $\tilde{h}_t = tanh(W.[r_t * h_{t-1}, x_t])$

✓ TF描述GRU层

```
tf.keras.layers.GRU(记忆体个数,return_sequences=是否返回输出)
return_sequences=True 各时间步输出ht
return_sequences=False 仅最后时间步输出ht(默认)
例:
```

```
model = tf.keras.Sequential([
    GRU(80, return_sequences=True),
    Dropout(0.2),
    GRU(100),
    Dropout(0.2),
    Dense(1)
])
```

```
import numpy as np
    import tensorflow as tf
    from tensorflow.keras.layers import Dropout, Dense, GRU
    import matplotlib.pyplot as plt
    import os
    import pandas as pd
    from sklearn.preprocessing import MinMaxScaler
    from sklearn.metrics import mean squared error, mean absolute error
    import math
    maotai = pd.read csv('./SH600519.csv') # 读取股票文件
    training set = maotai.iloc[0:2426 - 300, 2:3].values # 前(2426-300=2126)天的开盘价作为训练集,表格从0开始计数,2:3 是提取[2:3)列,前闭后开,故提取出C列开盘价
    test set = maotai.iloc[2426 - 300:, 2:3].values # 后300天的开盘价作为测试集
14
15
    sc = MinMaxScaler(feature range=(0, 1)) # 定义归一化: 归一化到(0, 1)之间
    training set scaled = sc.fit transform(training set) # 求得训练集的最大值,最小值这些训练集固有的属性,并在训练集上进行归一化
    test set = sc.transform(test set) # 利用训练集的属性对测试集进行归一化
    x train = []
    y train = []
23
    x \text{ test} = []
24
   y test = []
```
